Remedies for Omicron — "(Oh)micron" not
"(Ah)micron"

by Sterling D. Allan, 228033, P.O. Box 250, Draper,
UT 84020 USA

Dec. 1, 2021

The new ^{omicron} COVID variant has introduced a Greek letter name into mainstream vernacular that hitherto was only seen written out, not spoken, for the most part — by anyone. It has ^{created} a humorous phenomenon of a wide range of pronunciations in the media, both by hosts and guests, including M.D.s ^{and} Professors.

Part of the ^{leading to} problem is this ^{confusion} ~~lack of consistency~~ is that Webster's gives two pronunciations: "omicron (äm'ikrān, ō mi-)" [ä: Father; i: if]. You'll sometimes hear the same person pronounce it both ways within a couple of minutes, insecure in how to say it.

I submit that the most correct pronunciation is "(Oh)micron" because (A) there is a strong correlation between the Greek and English alphabets, both in sequence of letters and pronunciation, not to mention how replete Greek words and derivatives are found in the English language; and (B) the first letter in an alphabet letter name corresponds to its pronunciation: alpha, beta, etc. i.e. the first portion of omicron should be pronounced "oh." Following kappa, lambda, mu, nu; prior to pi (π) — one of the most familiar Greek letters. (Yes, omicron is immediately preceded by xi (ξ).) In the sequence of variant names, nu and xi were skipped because "nu" is too easy to confuse with "new," ^{when spoken} creating a "who's

on first" (short) type of mix-up, and calling it the "xi variant" would be akin to calling COVID the "China virus" — a political taboo for the propagandists.

It turns out there is a significant Alphabetical, unintended (by me) ^{indicating} relative providence.

Two days ago, at the top of p. 642 of my media notebook, I wrote in clear writing, blue pen, the name omicron and its pronunciations; and that page ended up having quite a few notes about the variant.

Today, I noticed that the page number is 642, which is hugely significant in this context. 642 is the ASCII sum of "corona", which I looked up on March 13, 2020.

On p. 642 of Strong's '07 (ISBN 978-1-59856-378-8) is the page heading (opening & closing entries) "Leftest-Leprosy" — a play on words and parallel of feared illnesses. That's certainly relevant. Page 642 of the Bible appendix of the Church of Jesus Christ of Latter-day Saints,

 a Father i. if ^{to} show up (unintentionally) at the top of p. 642 of my media journal, would indicate to me that the omicron variant is likely to be more of the same plannedemic paranoia, making a mountain out of a mole hill, a peak-pooling simple, effective remedies, exaggerating numbers, statistics. ^(counting a covid death as if it wasnt the primary contributor) ~~It~~ ^{COVID} wasn't the primary contributor.

Yes, COVID can be terrible and deadly. But if you employ remedial measures, its severity can be profoundly diminished. Children are nearly unaffected by it, unless they ^(except) have conditions that make them susceptible - in which case counter measures are indicated. vitamin C and D3 along with the ^{mineral} supplement Zn are great for bolstering the immune system to be able to naturally defeat the virus when exposed. Hydroxy chloroquine (HCQ) profoundly augments this, either for those who contract the virus, or prophylactically, for those who may have been exposed or who may soon be exposed.

In order to get the money out - incentivizing the numbers)

Natural immunity from overcoming the virus provides a much better resistance thereafter than vaccinated immunity, which tries to immitate natural exposure. The vaccine only summarizes a person to a portion of the virus, whereas natural immunity gives a person immunity to far more of the viral proteins. I heard this compared the fingers of the hand. The vaccine immitates the thumb, but natural immunity covers all the fingers, including the thumb.

People with natural immunity should be preferred ^{as employees over} those who have ^{only} been vaccinated. They shouldn't be persecuted as ^{dangerous} ~~vaccers~~ ^{vaccers} for not wanting to also get vaccinated because of its possible side-effects. Judy Mikovits documents these concerns

Essentially go missing (out of sight) other than a chain link fence and mindless obedience. The doctor makes go missing (out of sight) with a chain link fence and mindless obedience. (like trying to help with a chain link fence and mindless obedience.)

Yes, it would be good to consult with your doctor about these things, but ultimately, you should take responsibility for your own health.

There is no rain, but the locusts to devour the land, or if I send pestilence [epidemic] among my people; I will command the locusts to devour the land, or if I send pestilence among my people;

herb
is "Plague of Corruption". There are many serious reasons to view the vaccine industry as presently constituted.

Ivermectin (iv?) is another inexpensive, safe remedy that is very effective in preventing severe infections.

A positive, upbeat attitude is crucial to a strong immune system. Fear profoundly diminishes the immune response.

For those who have a strong immune system and a good attitude, I would recommend purposely exposing yourself to a low amount (e.g. 15 mins in near vicinity to an infected person) (severity is proportional to exposure extent), at a convenient time, got over it, and be done, having remedies ready if needed (HEQ or Ivermectin). That's all you've got. You'll gain a better immunity than any vaccine. (p.6) &

The monoclonal antibodies also provide a good remedy (not so cheap).

The pharmaceutical conspirators do not want us to know about these remedies, because they love what they're able to get away with when society is scared.

With faith in God, you'll be guided to what will be best for you. As a society, our remedy is set forth in 2 Chron. 7:14-16

"If my people, which are called by my name, shall humble themselves, and pray, and seek my face, and turn from their wicked ways; then (it) will hear from heaven, and will forgive their sin, and will heal their land."

I believe we can do this and will.
 (transmission)
 If this is the case and it spreads more readily than Delta, reducing the severity of the pandemic is a possibility.
 It takes over the usual progression of pandemics.
 Those with natural immunity are those who are protected from the infection, much more than those who are vaccinated only.

One of the concerns about the vaccine is the protein. It has been shown to be immunogenic, and an immune response is triggered. She described its structure.
 Omicron variant is the most recent is that with the crown of 30 mutations which may be effective. Fortunately, the mRNA vaccine variant said it is not as good as the original.
 I believe we can do this and will.

5

On 12/1, prior to writing this article, I found another AB correlation of significance to omission. I was looking at the NT Greek def's starting with that letter, to see how they are transliterated. What stood out as both relevant and foreordained was the first def. starting omission.

⊕ (3588) ὅ ὅ...; the ὅ - this, that, one, he, she, it, etc.

Note that ^{this particle is a of speech} it is just the letter, o (omeron), and that the transliteration (no) in pronounces the o as ὄ (oh). This is the only

Greek letter that is identical in shape to the English counterpart. Note that one of the Biblical words (ἓ) translated (from the Greek ο) is "one" tying in a significant way to the title of the book I'm writing: None to One: Evoking the Repentance Clause of Prophecy.

On a hunch (intuition), I turned to OT def. A3588 to see if it might tie in some way. It does. It's also a particle of speech (ἵ) ki) and includes the verbatim meanings, "that, because that, in that, so that, than that." While it's not unusual for OT & NT definitions of the same number to harmonize; it is more rare for them to include verbatim words like you see here. This points to a foreordination of this "oh) omeron" v. "oh) micron" pronunciation dilemma being able to allow me to weigh in, to bring attention to my work. Maybe this blog post will go viral. ☺

< back to p. 2 ⊕ >

⊕ < From lat. p. 4 > Alternatively, it could be more virulent because the unprecedented strategy of un-

spread, vaccinating can select for virulence.

③ (from middle 7) If you're already immune, then the virus won't make you sick when you are exposed to it.
